Create an MVC Core Web Application for User Personal Detail as per given requirements:

**1.** Create database as per given formate in SQLServer.

**Users :** UserId, UserName, Password, Email (Enter minimum 5 records manually)

**PsersonalDetail :** UserId, DateOfBirth, Gender, Hobby (Comma Separated Values), Education (Comma Separated Values), City

**2.** Create a Login page to allow user to enter user credential as UserId / Email and password. On login failure, give failure message to the user and on successful login redirect user to personal details to show his / her personal information.

**3.** Allow user to search other users based on advance search. The advance search will provide facility to search user with any combination of provided detail by the users.

**4.** Create Web API for all functionalities.
